Windows Server 2012 now available on all TurnKey Internet server offerings

FOR IMMEDIATE RELEASE

Latham, NY, November 5, 2012

TurnKey Internet today has announced the addition Microsoft's most recent operating system, Windows Server 2012, to its product offerings. The addition is the latest update to their suite of cloud-based server solutions.

Microsoft recently released the first new operating system, with enhancements of this magnitude, since 2009. Windows Server 2012 has additional features that simplify remotely managing large clusters of servers in data centers.

Customers of TurnKey Internet can now enhance scale and secure workloads with Windows Server 2012, cost-effectively virtualize their data center, manage infrastructure efficiently, and build cloud environments. It runs on standard, Intel-style processors and boasts numerous upgrades, such as CPU throttling for IIS and enhanced restrictions on IPs, for better deterrence of denial of service attacks. The new operating system also features improvements in virtualization of desktops, as well as remote access. Best of all, the transition is smooth. Customers are able to upgrade to the new operating system with the help of TurnKey Internet, from start to finish, and according to their unique, individual needs.

TurnKey Internet has been running extensive testing on Windows Server 2012, and has deemed it a great improvement since Microsoft's last release. "The cloud is not just transforming businesses, but whole industries," remarked Adam Wills, CEO of TurnKey Internet. "By offering Windows Server 2012 on TurnKey servers, we are providing the solution for businesses to keep up with this transformation in every way, as well as cultivating it ourselves. Management is made easier, productivity is amplified, and running your business is enhanced altogether."

About TurnKey Internet:
